

The deterministic estimating engine that turns construction tenders into sourced, auditable work plans.

Every quantity has a formula. Every formula has a source. Every decision is replayable.

■ THE PROBLEM

Estimating is the bottleneck of every bid.

½ day per object

Estimators (přípraváři) build bills of quantities by hand in spreadsheets — slow and impossible to scale.

Opaque numbers

You can't see why a quantity is what it is. Reviewers and clients can't trust or defend the figures.

Costly errors

A mispriced bid means a lost tender — or a won tender with no margin. The risk sits on the estimator.

Preconstruction estimating is manual, opaque and error-prone — yet it decides who wins the work.

■ THE SOLUTION

We decompose the work — others only match a price.

MATCH · the rest of the market

Line item → **catalogue price.**

A black box. You see a number, not the reasoning.
Nothing to audit, defend or reproduce.

DECOMPOSE · STAVAGENT

Work → **materials + labour + machines + time.**

Each value comes from an explicit formula and a norm source (ČSN, TKP, OTSKP). Traceable, auditable, replayable — with a confidence score on every number.

Determinism first — and the whole engine is exposed over MCP, so any AI agent can run it.

From tender documents to a defensible estimate.

01

Ingest

Drawings, technical reports (TZ) and bills of quantities (výkaz výměr).

02

Extract

Deterministic first — regex + catalogue; the model only as fallback.

03

Decompose

Quantities derived from formulas, each tied to a source-norm.

04

Price & export

Bind to the public OTSKP catalogue; export to Excel / KROS.

Built on Google Cloud — FastAPI + OCR on Cloud Run, Cloud SQL, Vertex AI.
Exposed over MCP — agent-native: any AI agent can orchestrate the full pipeline.

Live today — not a concept.

- Deterministic output — days, takts and cost, computed instantly in the browser.
- PERT P50 / P80 / P90 from 10,000 Monte-Carlo runs.
- Every value cites its norm — ČSN, DIN 18218, TKP — with automatic site warnings.

The image shows the 'Kalkulátor betonáže' (Concrete Works Calculator) interface. The title bar indicates 'Kalkulátor betonáže' and 'ŘÍMSY ZE ŽELEZOBETONU DO C30/37 (B37) — 26.25 m³ [Nový]'. There are buttons for 'Stáhnout Excel (.xlsx)', 'Stáhnout CSV', 'Aplikovat do pozice', and 'Kopírovat Gantt'. The main form is divided into sections: 'Krok 1 z 5: Element', 'ELEMENT', 'Typ elementu' (set to 'Římša'), 'Rozpoznáno z OTSKP katalogu (confidence 100%)', 'Vložit text z TZ (Ctrl+V)', 'AI doporučení (podstup, bednění, normy)', and 'Římša' (Orientace: vodorovný | Obltžnost: 115x | Výztuž: -120 kg/m² | Jeřáb: ano). Below this are buttons for 'Zpět' and 'Další'. The 'CENY (VOLITELNÉ)' section has a checkbox for 'Počítat bez cen (pouze harmonogram)' and a note about the calculation method. The 'Jeřáb (Kč/směna)' and 'Čerpadlo (Kč/h)' sections have input fields for 'odhad'. The 'Resetovat formulář' button is at the bottom. The right sidebar shows 'Zdroje' (Sources), 'PRACOVNÍ ČETÝ' (Workforce), 'PARAMETRY VÝPOČTU' (Calculation Parameters), and a summary table with 'CELKEM DNÍ' (17), 'POČET ZÁBĚRŮ' (1), 'NÁKLADY PRÁCE' (46 788 Kč), and 'ÚSPORA VS. SEKVENCÍ' (0%). The 'PERT (orient.): 14.5 optimistická — 17 střed — 22.1 pesimistická prac. dní' is also shown. The 'Optimalizace zdrojů' section indicates 'Optimalizace zdrojů — aktuální nastavení je optimální'. The 'Varování' (Warnings) section lists several items related to the concrete work.

Concrete-works calculator — element auto-classified from the OTSKP catalogue, fully sourced output. One platform, many kiosks.

Already run on real Czech tenders.

5

real pilot projects, end to
end

Residential project

A complete priced budget (KROS) generated from the tender documents.

Industrial hall

A 255-line estimate across all trades.

Public-works tender

A tender-ready bill of quantities with sourced quantities.

Domain-validated by a senior preconstruction estimator with 20+ years of experience.

Built for the people who price the bids.

WHO

Preconstruction estimators at contractors.

Czech & Slovak tendering today — a market where every public and private project needs a priced bill of quantities, and every contractor runs the same manual process.

MODEL

SaaS + usage credits.

Self-serve subscription with three credit tiers.
Estimators pay for throughput; the deterministic engine keeps the marginal cost low and the output auditable.

Same workflow, same pain across all of European tendering — the wedge is Czech/Slovak, the market is the continent.

■ WHY IT SCALES

Universal core, regional adapters.

Expansion means adding an adapter — not rebuilding. Agent-native via MCP, built for the agentic era.

What we're looking for.

TEAM

Alexander Prokopov

A practising preconstruction estimator who built the entire platform solo — Python / FastAPI, Google Cloud (Cloud Run, Cloud SQL), Vertex AI and MCP. The founder is the user.

THE ASK

- **Access to Cemex's network**
pilots and venture-clienting with partners
- **Technical & architecture support**
on Google Cloud / Vertex and agentic orchestration
